

MONTHLY WEBSITE REPORT

intentional.ae

1 March – 1 April 2026

At a glance

Headline numbers for the period.

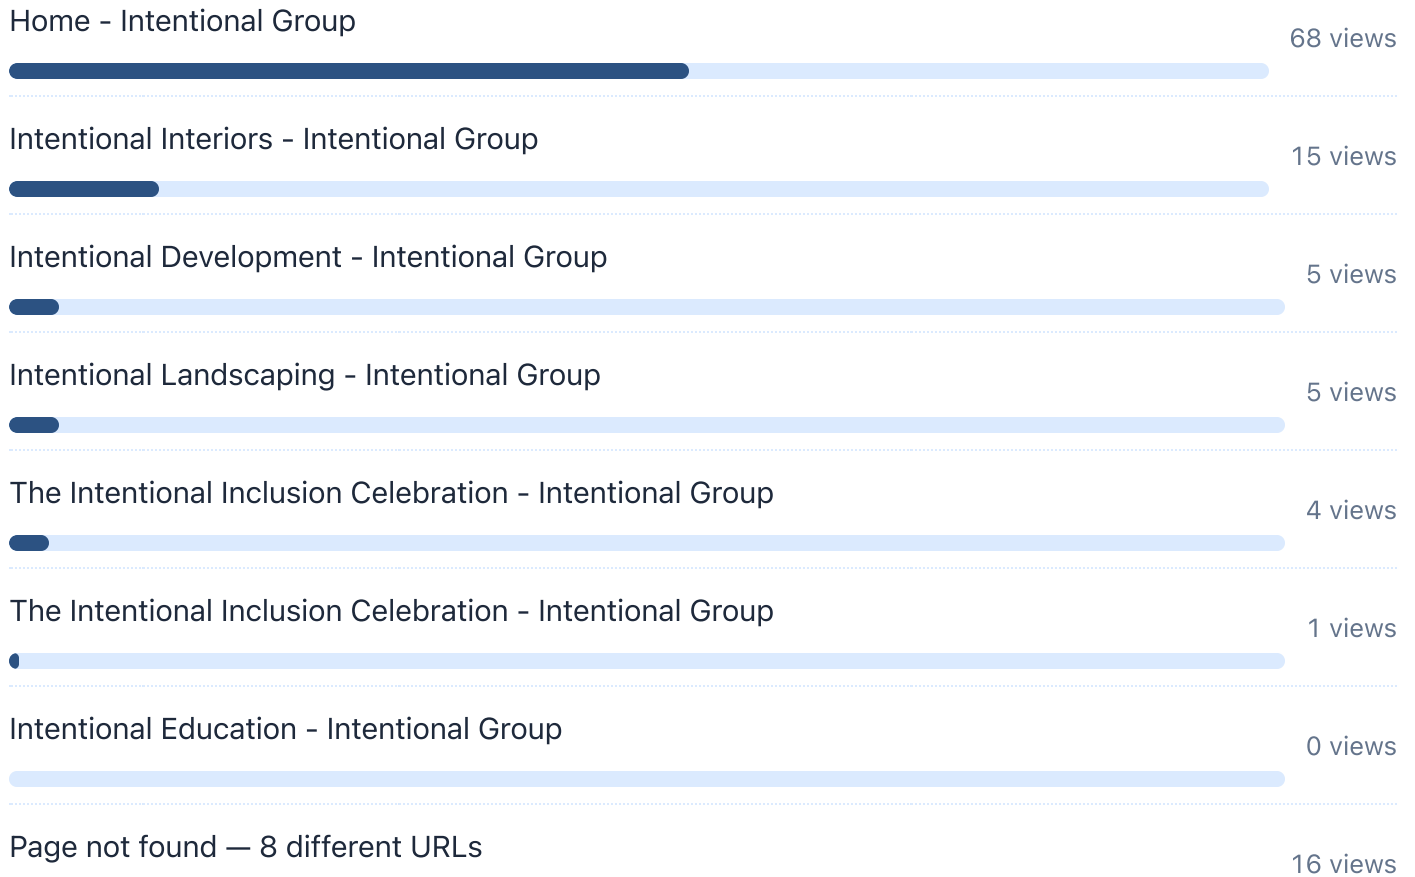

Visitors day by day

Daily unique visitors across the month.

Most visited pages

Which pages people looked at. Longer bars = more views.

About the "Page not found" entries. The 16 views (14% of the month's pageviews) against missing pages all come from automated bots and vulnerability scanners — typically probing for abandoned phishing kits (fake Netflix / Facebook login pages) or generic login URLs. No real page on the site links to any of these URLs, so **nothing is broken**. The noise is visible here only because Google Analytics counts every request.

How visitors found the site

The route visitors took to reach intentional.ae.

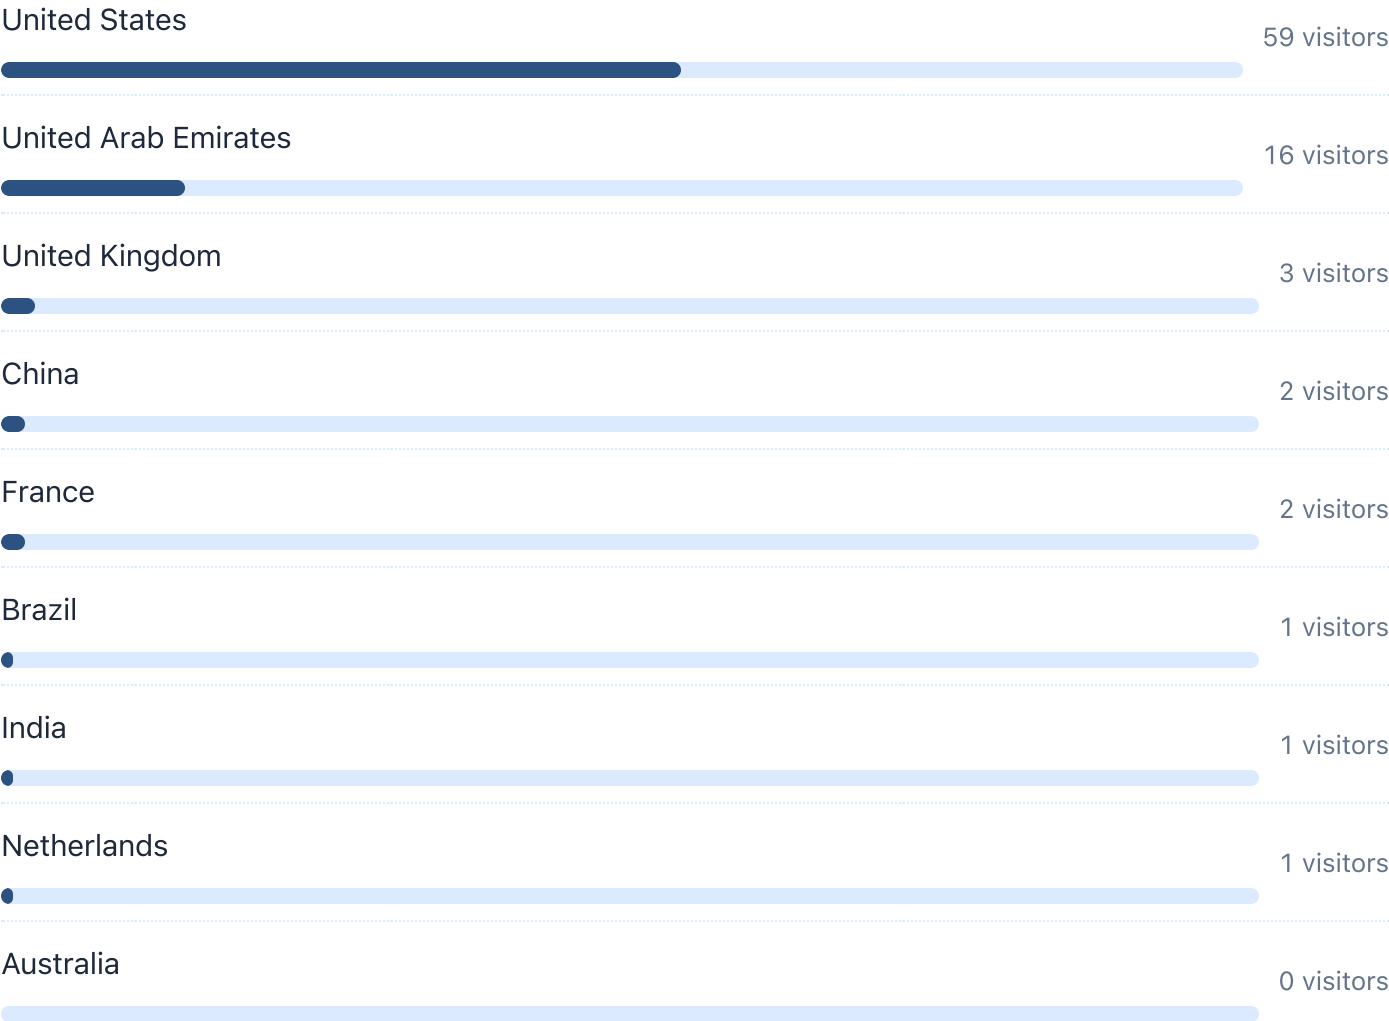

Unassigned — Source couldn't be determined

1 visits

Where visitors came from

Top countries by number of visitors.

What they used

The device type visitors browsed on.

■ Mobile **52%** (44)

■ Desktop **48%** (40)

Maintenance performed this month

Behind-the-scenes work carried out on the site during this period.

Software updated

component	from	to	notes
Site software (Astro)	version 4	→ version 6	the platform your site is built on — two major releases newer
Sitemap tool	3.1	→ 3.7	helps search engines find all your pages
Build system	Node 20	→ Node 22	required to work with the newer site software

Security advisories resolved

Known vulnerabilities that were patched by the updates above.

SERIOUS Fixed a flaw that could let someone bypass login checks on sites using protected areas

SERIOUS Fixed a way malicious code could be injected into pages a visitor sees

SERIOUS Fixed a bug that could reveal internal files to an attacker during development

SERIOUS Fixed another login-check bypass using specially-encoded web addresses

SERIOUS Fixed a flaw that could let a malicious site trick yours into trusting it

MODERATE

Fixed a handful of smaller issues in supporting tools the site uses internally

MODERATE

Fixed a development-tool bug that could expose data during local testing

MODERATE

Patched general security updates in the build tools

Code migrated for the new version

Small internal adjustments required by the framework upgrade.

- ✓ Updated the internal way the site reads and displays your business page content so it works with the new platform version.
- ✓ Updated the page-transition feature (the smooth fade between pages) to use the new component name the platform now expects.

Verification

Checks confirming the site is healthy after the work.

- ✓ The site was rebuilt from scratch — all 7 pages generated without any errors.
- ✓ The site was tested locally: homepage, a business page, and the event page all loaded and worked correctly.
- ✓ The site was scanned for known security problems — all 8 issues (5 serious, 3 smaller) have been fixed.
